## PERFORMANCE ENGINE BEARINGS

### If you place demands on your engine you must demand the best!

High performance driving demands that you use the best parts. So rely on ACL's Race Series performance engine bearings to perform to exacting race standards you expect. They provide the dependability it takes to hold up under higher RPM conditions. The unique combination of design, metallurgy and engineering come together to deliver what drivers expect from high performance trimetal bearings. These Race Series performance engine bearings go the distance.

So, if you're looking for the best result, demand the best - demand ACL Race Series performance engine bearings.

### FEATURES OF ACL RACE SERIES PERFORMANCE ENGINE BEARINGS

#### Precision Manufacturing

ACL Race Series performance engine bearings are manufactured to exacting tolerances with particular attention paid to wall thickness accuracy. This ensures reliable fit and helps maintain consistent clearances.

#### Bearing Material Enhancements

A blend of characteristics to provide high strength and excellent seizure resistance.

No flash plating is applied to further improve bearing retention and maximise heat transfer.

ACL Race Series performance engine bearings are identified from the standard range by the following suffixes:

**H** = ACL Race Series.

**HX** = ACL Race Series with 0.025mm (0.001") extra clearance.

**HD** = ACL Race Series with location dowel holes.\*

**HXD** = ACL Race Series with 0.025mm (0.001") extra clearance and location dowel holes.\*

\*Connecting rod bearing applications only.

LAYER	ALLOY
<b>Overlay</b>	Lead-Tin-Copper
<b>THICKNESS (Typical)</b>	0.013mm* 0.018mm
*Connecting Rod Bearings Only - Reduced for increased fatigue resistance	
Seizure resistant - Low friction and deformable	
<b>Barrier</b>	Nickel
<b>THICKNESS (Typical)</b>	0.0001mm
Separation Layer	
<b>Lining</b>	Copper-Lead-Tin
<b>THICKNESS (Typical)</b>	0.3mm
Fatigue Strength - Strong yet deformable	
<b>Steel</b>	SAE1010 (High tensile)
<b>THICKNESS (Typical)</b>	Rem
High Strength - supports bearing lining	

## Bearing Design Enhancements

### Crush increased for:

Improved bearing retention from higher radial contact pressure. Locks the bearing into the housing.

More effective heat dissipation through improved thermal transfer.

### Bearing Eccentricity

Definition: Gradual reduction in wall thickness between the crown and parting line.

Race Series performance engine bearings feature increased eccentricity to increase improve shape adaptation to compensate for bore distortion at high speed operation.

Assists in the formation of hydrodynamic oil film.

### Main Bearings with Extended Grooves

Full (180°) grooved uppers with matching partial groove in lowers.

- Reduces interruption to big end oil supply.

Tapered groove run-out.

- Smooths big end supply cut-off avoiding pressure pulsing and cavitation.

### Enlarged ID Chamfers

Accommodate larger fillet radii on performance crankshafts.

Note: All information in this catalog has been collated from the most authoritative and reliable sources. As far as we are able to ascertain, it is correct. No responsibility can be accepted should any details be found to be incorrect. We welcome advice on any errors which may come to your notice.

Oil Clearances: Please note that in some instances, the vertical oil clearances specified in the ACL catalog may differ from those of the OE vehicle manufacturers', as the ACL catalog's clearances are a theoretical calculation derived from the maximum and minimum clearances obtainable with all shaft diameter / housing bore and bearing thickness combinations. Always adhere to the OE vehicle manufacturers' recommended clearances where available.

ACL Distribution, Inc., and any of its affiliates (“ACL”), reserves the right, at any time, to modify, amend, alter or update the following terms of use, and, by purchasing any parts in this catalog (the “Parts”), you agree to be bound by the following and any such modifications, amendments, alterations or updates:

## **DISCLAIMER**

Proper service and repair procedures are vital to the safe, reliable operation of all vehicles as well as the personal safety of those performing the repairs. Standard safety procedures and precautions (including use of safety goggles and proper tools and equipment) should be followed at all times to eliminate the possibility of personal injury or improper service which could damage the vehicle or compromise its safety. Installation of the Parts could affect your vehicle’s manufacturer warranty coverage.

ACL is not responsible for damages to your vehicle’s engine or the Parts resulting from the failure to properly maintain or repair your vehicle or the use of the Parts in non-standard, off-road applications. You should keep your vehicle in good maintenance and repair and you agree to assume all risks of utilizing the Parts in off-road or performance applications.

## **NO WARRANTIES**

DUE TO THE INTENDED USE OF PERFORMANCE APPLICATIONS, THE PARTS ARE SOLD ON AN “AS IS” BASIS, WITHOUT ANY WARRANTIES OR REPRESENTATIONS, EXPRESS OR IMPLIED, OF ANY KIND, INCLUDING, WITHOUT LIMITATION, MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR ANY IMPLIED WARRANTY.

## **LIMITATION OF LIABILITY**

IN NO EVENT SHALL ACL BE LIABLE FOR ANY DAMAGES (INCLUDING, WITHOUT LIMITATION, DIRECT, INDIRECT, PUNITIVE, GENERAL, INCIDENTAL, SPECIAL OR CONSEQUENTIAL DAMAGES, CLAIMS FOR PERSONAL INJURY, WRONGFUL DEATH OR LOST PROFITS, OR DAMAGES RESULTING FROM BUSINESS INTERRUPTION) WHETHER IN ACTION OR UNDER CONTRACT, TORT OR STRICT LIABILITY OR OTHERWISE, THAT RESULT FROM THE USE OF, OR INABILITY TO USE, THE INFORMATION, MATERIALS, OR PRODUCTS CONTAINED IN OR PURCHASED FROM THIS CATALOG. BECAUSE SOME STATES DO NOT ALLOW THE EXCLUSION OR LIMITATION OF LIABILITY FOR CONSEQUENTIAL OR INCIDENTAL DAMAGES, IN SUCH STATES LIABILITY IS LIMITED TO THE FULLEST EXTENT PERMITTED BY LAW. ALL CLAIMS SHALL BE GOVERNED IN ALL RESPECTS BY MICHIGAN LAW, WITHOUT REGARD TO CONFLICT OF LAWS PRINCIPLES.

Any claims arising in connection with the use of, or inability to use, the information, materials, or products contained in or purchased from this catalog must be brought within one (1) year of the date giving rise to such action or be forever barred.

## **UNDERSTANDING YOUR CATALOG**

This catalog is designed in an index format to make the selection of ACL engine bearings an easy task.

1. Locate the Manufacturer – these names are listed at the top of each page in alphabetical sequence.
2. Locate the type of engine you have by using the [Engine](#) Index at the beginning of each section. Confirm your engines details by comparing the displacement, cylinder configuration and year breaks. Engine designations and VIN codes are also provided to help narrow down your selection. Once you have found the engine you are looking for, note the corresponding Line number.

The following explanation provides all the knowledge required to obtain the most from your ACL catalog/workshop manual.

1. TYPE AND LOCATION

ROD denotes Connecting Rod big end bearing. Each engine requires one pair of bearings per rod. ACL bearings are generally sold in complete engine sets. Any pertinent comments affecting bearing sets are noted in the appropriate engine section.

MAIN	denotes Crankshaft Main Bearings. The position or location of each main pair in the engine is shown by numbering from the front (No.1) to the rear (flywheel end). Engines often require several pairs of different mains to make up a complete set, therefore ACL main bearings are only sold as complete sets.
(FI)	denotes the Flanged main bearing.
THRUST	denotes Thrust Washers. These are sold as engine sets and should always be ordered with the corresponding main sets.
CAM	denotes Camshaft bearings. It also includes the position of each bearing in the engine, using the same system as the main bearings (i.e. No. 1 cam bearing at the front). Camshaft bearings are generally sold in engine sets only.
SMALL END	denotes Small End Bush. Some engines have piston pins clamped or held with an interference fit direct in the eye or small end of the connecting rod and therefore do not require bushes. Where bushes are used, each connecting rod generally requires one bush. Small end bushes are sold as single pieces. Most small end bushes require boring after being fitted to the small end of the connecting rod. A few only require a light ream (see notes in the body of the catalog).
AR AUXILIARY	denotes Auxiliary Shaft bearings. It also includes the position of each bearing in the engine, using the same system as the main bearings (i.e. No. 1 Auxiliary Shaft bearing at the front). Auxiliary Shaft bearings are generally sold in engine sets only.
BALANCE SHAFT	denotes Balance Shaft bearings. It also includes the position of each bearing in the engine, using the same system as the main bearings (i.e. No. 1 Balance Shaft bearing at the front). Balance Shaft bearings are generally sold in engine sets only.
CAM TOWER	denotes Cam Tower repair inserts. These are available for the reconditioning of some alloy cylinder heads. For the required housing size for each of these sets refer to the technical specifications listed in the body of the catalog.

## **2. STANDARD SHAFT SIZE**

Minimum & Maximum dimensional information supplied in metric and imperial format.

## **3. HOUSING BORE**

Minimum & Maximum dimensional information supplied in metric and imperial format.

#### **4. MAX. BEARING THICKNESS**

Maximum dimensional information supplied in metric and imperial format.

#### **5. VERTICAL OIL CLEARANCE**

Minimum & Maximum dimensional information supplied in metric and imperial format. This is generally the calculated theoretical oil clearance when the “stack up” of tolerances of the housing size, journal size and bearing wall thickness are taken into account.

#### **6. MAX. OVERALL LENGTH**

Maximum dimensional information supplied in metric and imperial format.

For each dimension, the metric figure is shown first and the imperial immediately follows.

#### **7. MATERIAL CODE**

F1	Cast white metal, tin based, steel based. NOMINAL COMPOSITION: 89% Tin, 7.5% Antimony, 3.5% Copper
F23	Cast white metal, lead based, steel based. NOMINAL COMPOSITION: 83% Lead, 15% Antimony, 1.0% Tin
F100	Sintered Copper Lead, unplated, steel backed. NOMINAL COMPOSITION: 80% Copper, 10% Tin, 10% Lead
F147	Rolled Aluminum Tin, steel backed. NOMINAL COMPOSITION: 91% Aluminum, 6% Tin, 1.5% Silicon, 1% Copper, 0.5% Nickel
F250	Sintered Copper Lead, unplated, steel backed. NOMINAL COMPOSITION: 74% Copper, 23% Lead, 3% Tin
F780	Sintered Copper Lead, overlay plated, steel backed. NOMINAL COMPOSITION: 74% Copper, 24% Lead, 2% Tin
F781	Sintered Copper Lead, overlay plated, hardened steel back. NOMINAL COMPOSITION: 74% Copper, 24% Lead, 2% Tin
F810	Cast Aluminum Tin Silicon, steel backed. NOMINAL COMPOSITION: 88% Aluminum, 9% Tin, 2.5% Silicon, 0.8% Copper
F817	Rolled Aluminum Tin, steel backed. NOMINAL COMPOSITION: 83% Aluminum, 17% Tin
F820	Rolled Aluminum Tin, steel backed. NOMINAL COMPOSITION: 80% Aluminum, 20% Tin
F830	Rolled Aluminum Tin, steel backed. NOMINAL COMPOSITION: 70% Aluminum, 30% Tin

Literature dealing with the different characteristics of these bearing materials is available on written request to ACL.

## 8. QTY SET

This denotes the numbers of pieces per set.

## 9. BEARING SHELL NO.

Bearing shell numbers applicable to the pairs or full circle bearings (e.g. cam bearings) corresponding to their location in the first column. All of the pairs and/or full circle bearings required to make the set are shown here.

## IDENTICAL HALVES OR UPPER AND LOWER

This information is provided to indicate where the pairs are made up of different upper and lower halves rather than containing identical uppers and lowers. Where uppers and lowers differ, "U" and "L" are stamped on the respective halves and normally the notch or tang position will prevent incorrect fitting. However, it is possible to fit some bearings upside down, particularly in certain Japanese applications. If this happens, it can effectively block off crankpin oil feed with disastrous consequences.

### Important Note:

Engine location for the bearing shell number is listed in column 1, Type and location. Failure to position the bearings in the numbered location will possibly result in engine bearing failure.

## 10. ENGINE SET NO. SIZES AVAILABLE

This column has been shaded along with the engine identification section heading for each engine group listing for easy selection of sets.

Any pertinent comments affecting bearing set or bush selection are noted immediately top the right of the type of bearing listed in Column 1, type and Location. The range of sizes serviced by ACL is detailed below the bearing set number.

## ACL REPLACEMENT SET NUMBERING SYSTEM

# TRIMETAL or BIMETAL

## ACL – The right choice

Which material is best? You decide based on your needs.

Bearing Type Characteristic	Duraglide	Aluglide
<b>Strength</b> Ability to assume prolonged, high fatigue loads	Babbitt overlay (<20HV) is supported by a strong copper lead alloy (>50HV) in turn supported by the steel backing. Strength is high as long as the overlay is thin (<20um)	Strength is engineered through targeted alloying and modification of the Aluminum structure particularly with the addition of Silicon (from 45 to 55HV). No overlay means that the load is assumed directly by the alloy and transmitted through to the steel.
<b>Anti-Seizure</b> <b>Conformability</b> Ability to adapt to assembly and misalignment errors  <b>Compatibility</b> Ability to accommodate shaft to bearing contact through thin oil films  <b>Emergency Running</b> Ability to continue operation during temporary oil film breakdown	Very soft Babbitt overlay readily adapts. Copper lead alloy has moderate conformability and helps to adapt where shape errors are significant.  Crankshaft journal finish is the dominant factor. Contact with bearing surface results in adaptation through wear of the Babbitt layer with no damage to the shaft.  The lead in the Babbitt and copper-lead alloy has natural lubricity and can function as a dry lubricant. The low melting point of the alloy also allows it to provide a temporary liquid lubricant.	Alloy composition, casting and heat treatment methods develop exceptional toughness. This enables the alloy to conform without detriment to strength.  Bearing and shaft interact beneficially. Extra fine silicon particles at the bearing surface act as a mild polishing agent that moderates shaft surface roughness. System adapts to maintain oil film integrity. This is particularly effective when running against cast iron shafts.  The tin phase of the alloy provides lubricity and low melting point liquid lubricant but is not as effective as lead.
<b>Anti-Wear</b> Resistance to abrasion by shaft and dirt.	Babbitt alloys are prone to wear (see above), however the alloy composition is carefully controlled to optimize the strengthening effects of copper in turn minimizing the wear potential.	The relatively harder surface of the aluminum alloy has substantially reduced wear. Combined with shaft interaction (see above), which minimizes shaft abrasion, wear becomes insignificant.
<b>Embeddability</b> The ability to absorb dirt entrained in the oil without damage to the bearing or shaft	The soft Babbitt readily absorbs all kinds of dirt particles up to 15um without damage. Larger particles are accommodated less readily by the underlying layers.	As the aluminum alloy is substantially softer than shaft materials, hard particles of all sizes will embed rather than score the shaft. The toughness of the alloy ensures that the localized deformation does not compromise strength.
<b>Anti-Corrosion</b> Ability to withstand chemical attack from degraded or contaminated oil	Tin content in the alloys gives the lead partial protection from attack. If the bearing is worn to the copper-lead layer, resistance is minimal.	Aluminum tin based alloys are essentially inert to known contaminants.
<b>Applications</b>	Duraglide bearings provide a combination of high strength and the ability to withstand harsh/demanding operating conditions. This makes them ideal for performance/race engines and rebuilds.	Aluglide bearings provide a combination of moderate to high strength, good seizure resistance and excellent wear resistance. These bearings are ideally suited to general purpose applications (passenger cars and light commercial vehicles) where reliability and long service intervals are desirable. Aluglide bearings are highly preferred in modern import engines that have been designed for aluminum based bearings as OE standard fitment.

# The new generation engine bearings – smart, strong, tough.

ALUMINUMSILICON  
ENGINE BEARINGS

## New technology enhances proven materials.

Aluminum Tin materials have been around since the 1960's. It has traditionally been the choice of Japanese and European manufacturers for low load, gas, passenger cars. As the loads developed by high horsepower late model engines increased so too did the need for a stronger bearing material. Copper Lead Trimetal bearings have been the answer for higher load applications, but as the world becomes more environmentally conscious, the need for lead free engine components has increased, without sacrificing the load carrying capacity required for modern engines. The addition of Silicon as an alloying element to the Aluminum Tin family of bearing materials has elevated it to the next generation of performance materials. This is currently the choice of most OE manufacturers as the global mandate to have Lead free vehicles is enforced. An added benefit of the Aluminum Tin Silicon bearings is the excellent wear resistance properties, extending the service life of these parts.

## Smooth and clean - Aluglide is superior all the way.

However, BEWARE! Not all Aluminum Tin Silicon bearing materials are the same. Look at the photomicrographs below and compare the ACL strip cast microstructure to Brand X. The two are significantly different! The select alloying elements and heat treatments used by ACL have been proven by rigorous OE testing to go the distance, and they are truly lead free.

Photograph 1 F810

Photograph 2 Brand X

Although both structures show the basic features of typical aluminum tin silicon lining alloys, there are some significant differences. Specifically:

**Note A** The Brand X structure is generally coarser than F810 with large intergranular silicon particles. This suggests a standard casting method (moderate to slow freezing rate) that would not optimize the distribution of silicon within the alloy. Unless the freezing rate is extremely rapid (as with F810) there is only minimal solution of silicon within the aluminum grains. Also large silicon particles will be exposed at the bearing surface and act as stress raisers. In both cases the effect is to reduce the alloy toughness.

**Note B** Bonding surfaces, particularly between the aluminum bond layer and the steel are substantially less consistent than in F810 suggesting that bond strength is substantially compromised.

# Excellence in engineering, design and metallurgy produce outstanding engine bearings.

# Fitting Instructions

**To ensure a satisfactory bearing life, there are certain simple but vitally necessary rules which must be closely observed. Because extreme accuracy is built into precision insert bearings, they must not be filed, scraped or machined in any way.**

**They are machined to tolerances as fine as .00025 inches (0.006mm) and cannot be improved upon by any hand work, however skillful it may be. Follow the procedure outlined for a completely satisfactory bearing assembly.**

## 1. DISMANTLE

Before dismantling the old bearings, mark the bearing housings for reassembly identification - the caps must be reassembled exactly as removed.

## 2. INSPECT

Remove the crankshaft and bearings for careful assessment of the extent of wear or other damage. If either the crankshaft journal or bearing tunnel sizes are found to be outside the dimensions shown in this catalog, re-machining is recommended. If the used bearings exhibit tell-tale signs of unsatisfactory conditions in the engine, the source of these problems must be located and rectified as well.

Common faults that old bearings will highlight include bent or twisted rods, bent crankshafts, mis-aligned tunnel bores, unsatisfactory journal surface, insufficient or excessive nip, poor tunnel seats, mixed or reversed caps.

## 3. CLEAN

Careful cleaning of the engine block and all components must be undertaken to be sure of successful bearing replacement. Remove all gallery plugs prior to cleaning. There are several ways that the components can be thoroughly cleaned, e.g. the most commonly used methods are the Thermal Cleaning Systems (oven) or to allow the dis-assembled engine to soak in an agitated chemical bath (iron and aluminum-alloy components require different chemical cleaners). In these ways, all sludge and dirt accumulations, hidden and otherwise, are removed. If thermal or chemical cleaning facilities are unavailable a less thorough, and therefore less desirable method, is to physically remove the visible dirt and wash down with a solvent such as kerosene after removal of all gallery plugs. It is imperative to ensure that the entire lubrication system is completely clean and free of obstructions.

## 4. CHECK DIMENSIONS

- (a) Always accurately measure all journals and con rod and mains tunnels prior to assembly to be certain they are within the required tolerances, particularly if any re-sizing has been performed. Remember, the bore of the assembled bearing can only be as accurate as the housing into which it is fitted.
- (b) Check that replacement bearings are correct in all detail to the bearings removed, i.e.: - oil holes, grooves and locating notch.

## 5. CHECK NIP AND BACK CONTACT

It is necessary to check the NIP or crush fit of the new bearings in their housing and also the back contact if the old bearing backs have any bright, shiny areas.

The procedure of this operation is:

- (a) Apply a coating of bearing "blue" to the cleaned tunnel seating and the joint faces of the case or cap.
- (b) Clean and dry the bearings and apply bearing blue to the joint faces of one bearing. Assemble the bearings into the housings, tightening the holding bolts evenly to the correct tension. Threads should be oiled.
- (c) Accurately measure and write down the assembled internal diameters of each pair of bearings, then release the bolt or bolts on one side only. This should allow the joint faces to separate on this side. A feeler gauge of 0.10mm to 0.15mm (.004" to .006") should be accepted into the opening.
- (d) Release the remaining bolts and dismantle the bearing unit completely. An examination of the housings and the bearings should reveal an even transformation of "blue" from:
  - (i) Tunnel bores to back of bearing.
  - (ii) One bearing joint face to the other.
  - (iii) The cap joint face to the case joint face, or vice versa.

An uneven transference of blue indicates some "off standard" condition to be investigated and corrected.

## 6. CHECK OIL CLEARANCE

With tunnel sizes correct to specification and shaft journals unworn or correctly ground undersize, ACL finished-to-size bearings will provide a correct operating clearance, which can be quickly confirmed with the use of flexigauge on assembly.

Where doubt exists, or in special cases, oil clearance should be checked by accurately measuring and writing down each journal diameter and then subtracting this from the corresponding internal bearing diameters that were noted when checking the amount of nip. The difference between the two diameters represents the vertical oil clearance and this must fall within the specified tolerance shown against each part number in the application sections. Where recommended oil clearances are unknown, the following information will assist the machinist in establishing a journal size that will give a safe clearance:

<i>Diameter</i>	<i>Location</i>	<i>Whitemetals</i>	<i>F500, F820, F830</i>	<i>F780</i>
50-70mm (2.000-2.750 inches)	Rods	0.020-0.050mm (.0008-.0020in)	0.038-0.076mm (.0015-.0030in)	0.020-0.064mm (.0008-.0025in)
	Mains	0.025-0.064mm (.0010-.0025in)	0.050-0.089mm (.0020-.0035in)	0.025-0.076mm (.0010-.0030in)
70-90mm (2.750-3.500 inches)	Rods	0.025-0.064mm (.0010-.0025in)	0.050-0.089mm (.0020-.0035in)	0.025-0.076mm (.0010-.0030in)
	Mains	0.038-0.076mm (.0015-.0030in)	0.064-0.102mm (.0025-.0040in)	0.038-0.089mm (.0015-.0035in)

*Note:* These clearances are recommended for normal passenger car type applications. For truck, tractor and performance modified applications, add at least 0.013mm (.0005 in) to all figures.

## 7. ASSEMBLE

Assemble the bearing shells with the SHELLBACKS AND THE HOUSINGS PERFECTLY DRY, but use a liberal supply of heavy oil or suitable lubricant between the bearing metal surface and the shaft. Take a light tension on all bolts before finally tightening them **EVENLY TO THE CORRECT TENSION**. When they have been finally tensioned, it is advisable to give them a firm, sharp blow with a **SOFT** hammer to neutralize any torsion which may have been set up.

## 8. CHECK END FLOAT (THRUST CLEARANCE)

The recommended clearance differs from engine to engine though the following table provides a good workable guide. It is advisable to check thrust clearances at both thrust faces to ensure an accurate measurement.

<i>Journal Diameter</i>		<i>Recommended Clearance</i>	
50-70mm	(2.000-2.750in)	.10-.15mm	(.004-.006in)
70-90mm	(2.750-3.500in)	.15-.20mm	(.006-.008in)
90mm up	(3.500in - up)	.15-.25mm	(.006-.010in)

Copper-Lead thrust bearings should be given slightly more clearance than whitemetal and alutin thrusts and hard working engines should have a little more than normal duty engines, but always within the high and low clearance figures shown.

Most thrust washer sets and some flanged mains are available in an oversize. Consult the application sections for oversize thrust washer availability. Main sets with overwidth flanges are noted in the application sections with dimensional information for the particular engine set number shown below that section.

## 9. WARNING

**DO NOT ATTEMPT TO REVOLVE THE CRANKSHAFT UNTIL ALL BOLTS ARE FINALLY TENSIONED.**

# Flexigauge

Flexigauge is precision manufactured plastic strip.

It is available in two sizes and is used to check clearance of main and connecting rod bearings, and is suitable for automotive, marine and industrial applications.

The two sizes available together cover clearances from .001 to .006 in. or .025mm to .152mm and as follows:

<i>Reference</i>	<i>Covers Clearance Between</i>
AG-1 - (RG-1) (Green pack)	.001 - .003 in. or .025 - .076mm
AR-1 - (RR-1) (Red pack)	.002 - .006 in. or .051 - .152mm

Flexigauge strips - 12 in. long - are packed in individual envelopes, which are marked in appropriate graduation - one side in thousandths of an inch and the other side in millimeters. Ten strips in envelopes are packed in their appropriate colored carton.

Directions for use, which are printed on the outside of each carton for easy reference, are as follows:

1. Remove the bearing cap, wipe the journal and bearing shell clear of oil.
2. Place a piece of Flexigauge across the bearing at the crown. (See Figure 1).
3. Install the bearing cap and using a torque wrench tighten the bolts to the correct tension.  
**DO NOT REVOLVE THE SHAFT OR BEARINGS.**
4. Remove bearing cap. The Flexigauge will be adhering either to the bearing or shaft.
5. Compare the width of the flattened Flexigauge with the graduation on the envelope. The figure within the graduations indicates the clearance in thousandths of an inch or millimeters, depending on which side of the envelope is used. (See Figure 2).
6. Taper is indicated when Flexigauge is wider at one end than the other, the amount of taper being the difference between the readings. The widest part of the Flexigauge represents the area of least clearance. "Barrelling" of the shaft is when the Flexigauge is wider in the center of the bearing.

## PRECAUTION

When checking main bearings, with the CAP supporting the crankshaft, the weight of the crankshaft and flywheel must be taken off the bearing caps to avoid inaccurate results. This can be done, for example, by "jacking" on the crankshaft balance weight.

Main and connecting rod bearing clearances should be checked on the area of least journal wear. Main bearing checks should be made with the adjacent crankpin situated about 30° after bottom dead center.

Figure 1

Figure 2

## ACL SINTERED BEARING ALLOYS

ACL supplies a wide a range of automotive engine bearings, bushings and thrust washers to original equipment manufacturers and the aftermarket, worldwide. Although ACL manufactures several different materials to suit various applications, tri-metal copper lead is considered to be their premium material and is used in many aftermarket applications. These materials provide the widest range of load carrying capacity with excellent durability, making them ideal for connecting rod and main bearings in both street and high performance engines.

## BEARING CONSTRUCTION

1. Utilizing mild-steel strip onto which is added powdered copper lead metal alloy. The strip is heated and compressed to bond the alloy to the steel backing.
2. ACL sintered copper lead alloys are of a similar chemical composition and generally withstand the same high compressive loads as cast alloy materials.
3. A lead-tin-copper overplate is applied to copper lead bearings produced by ACL. It is necessary however, to include a nickel intermediate layer (barrier plate or dam) to prevent tin migration from the overplate, which is a natural metallurgical phenomenon. ACL's superior quality construction and control in electroplating eliminate potential overplate flaking.
4. The lead-tin-copper overplate used by ACL consists of approximately 90%lead/9% tin/1% copper. Overplate thicknesses are nominally .0007" for most automotive applications.

ACL Overplated Copper Lead Bearing Construction (Cast or Sintered)

1. Lead-Tin-Copper Overplate
2. Nickel Dam
3. Copper Lead Intermediate Layer
4. Steel Back

## Bearing Diagram

A knowledge of the meaning of the names of bearing parts will afford a better understanding of bearing design and will avoid a great deal of confusion and misunderstanding.

## Bearing locating devices:

Engine bearings must be provided with some means to keep them from rotating or shifting sideways in their housings. The most commonly used design is the locating lug. As shown in Figure 3, this consists of a protruding lug at the parting face of the bearing which nests into a slot in the housing that has been machined out to receive it.

Figure 3  
Locating lug fits into slot in housing.

Another approach is the locating dowel illustrated in Figure 4. The dowel can be located on the housing or on the back of the bearing, with the dowel hole being located in the mating part. In some cases, there is a dowel hole in both parts with the dowel being inserted as a separate piece.

Figure 4  
Locating dowel fits into dowel hole in mating part.

## Oil grooves:

Providing an adequate oil supply to all parts of the bearing surface, particularly in the load area, is an absolute necessity. In many cases, this is accomplished by the oil flow through the bearing oil clearance. In other cases however, engine operating conditions are such that this oil distribution method is inadequate. When this occurs, some type of oil groove must be added to the bearing. Some oil grooves are used to assure an adequate supply of oil to adjacent engine parts by means of oil throw off, and through oil drillings in the crankshaft e.g. to connecting rod bearings. Although oil grooves vary in size and shape, it has been found that a single groove instead of multiple grooves works the best. A few typical oil grooves are shown in Figure 5.

Figure 5  
Typical types of bearing oil grooves.

## Oil holes:

Most bearings receive their supply of oil through holes drilled in the crank-case. This necessitates a matching oil hole be provided in the bearing so the oil can flow into the oil clearance between the bearing and the journal. Some oil holes are provided to increase the flow of oil to nearby engine parts. When the bearing is equipped with an oil groove, the oil hole normally is in line with the groove.

The size and location of oil holes is critical. Thus, when replacement bearings are installed, care must be exercised to be sure that the oil hole matches the original equipment specifications.

## Eccentric wall:

Most bearings are manufactured with an eccentric wall. This means that the wall thickness gradually becomes thinner in a taper from the crown to the parting faces. This slight eccentricity built into the bearing wall will help increase the wedge effect to build the oil film under the loaded area and the eccentricity also allows a reduction in vertical oil clearance without reducing the effectiveness of the oil flow through the oil clearance space for cooling purposes. This small reduction in wall thickness is also an allowance for any "breathing" or distortion of the housing e.g. connecting rods.

Eccentric Wall Bearing

# REFERENCE DATA

**Crankcase Doweling**

There should be a positive method of aligning the cap and case halves of main bearings, such as dowel pins, tongue-in-groove caps, caps "nested" in the case, etc.

**Bolt Torque**

Crankcases should be machined at the same torque values used at final assembly.

**Main Bore Finish**

A 1.5 - 2.3 micrometers (60-90 microinch) finish (obtained by boring, honing, or grinding) is recommended. This will ensure proper bearing contact and heat transfer.

**Bore Tolerance**

.025mm (.001") on bores less than 250mm (10")  
.050mm (.002") on larger bores

**Taper**

TAPER ACROSS THE BEARING IN THE MOST HEAVILY LOADED AREA IS MORE CRITICAL THAN IN OTHER AREAS.

**Diametral Taper Tolerance**

Length	Tolerance	Tolerance*
Up to 25 mm (1")	.005 mm (.0002")	.003 mm (.0001")
25-50 mm (1"-2")	.010 mm (.0004")	.005 mm (.0002")
50 mm (2") and over	.013 mm (.0005")	.007 mm (.0003")

**Hourglass or Barrel-Shape Condition**

Same standards as taper.

**Out-of-Round**

Vertical dimension should not be larger than horizontal - .025mm (.001") maximum out-of-round permitted if horizontal is larger than vertical. (Vice-versa for vertically split cases of horizontally-opposed engines.)

**Main Bearing Bore Alignment Check**

Check by using an alignment bar:

Bore Size	Alignment Bar Diameter
Up to 100 mm (4")	.013 mm (.0005") under low limit of bore
100-150 mm (4"-6")	.020 mm (.00075") under low limit of bore
150 mm (6") and over	.025/.038 mm (.001/.0015") under low limit of bore

Thrust faces should be parallel and square to the main bearing bore axis within .025 mm (.001").

**Check by using a surface plate and indicator:**

Mount engine crankcase in running position on a surface plate and shim until the front and rear mains are aligned vertically, making sure to correct for any difference in the bore sizes.

By setting the indicator to zero on the vertical dimension of #1 main and subsequently checking the intermediate mains (always correct for bore variations), the vertical alignment of the case can be checked.

By placing the case on its side and following the same procedure as in preceding paragraphs (but this time setting the indicator as near as is practical to the parting line on the case half), the horizontal alignment can be checked. When performing this check, the main caps should be in place and properly torqued.

\*Applies to HEAVY-DUTY and/or HIGHLY LOADED ENGINES.

**Maximum allowed misalignments:**

Overall: .050 mm (.002"); .025 mm (.001")\*  
 Between adjacent bores; .025 mm (.001"), but  
 .013 mm (.0005") preferred; .013 mm (.0005")\*

**Oil Holes** Holes in bearings should be in line with holes in case within .75 mm (1/32").

**Crankshaft - Main & Crankpin Journals**

Diameter Tolerance	Shaft Diameter	Tolerance
	Up to 38 mm (1 1/2")	.013 mm (.0005")
	38-250 mm (1 1/2"-10")	.025 mm (.001")
	250 mm (10") and over	.050 mm (.002")

**Crankshaft Taper** TAPER ACROSS THE BEARING IN THE MOST HEAVILY LOADED AREA IS MORE CRITICAL THAN IN OTHER AREAS.

Journal Length	Diametral Taper Tolerance	
	Tolerance	Tolerance*
Up to 25 mm (1")	.005 mm (.0002")	.003 mm (.0001")
25-50 mm (1"-2")	.010 mm (.0004")	.005 mm (.0002")
50 mm (2") and over	.013 mm (.0005")	.007 mm (.0003")

**Hourglass or Barrel-Shape Condition** Same standards as taper.

**Out-of-Round (O.O.R.) Condition**

Shaft Diameter	Maximum Allowed O.O.R.
Up to 75 mm (3")	.013 mm (.0005"); .005 mm (.0002")*
75-125 mm (3"-5")	.013 mm (.0005"); .007 mm (.0003")*
125 mm (5") and over	.025 mm (.001"); .010 mm (.0004")*

**Axial and Circumferential Surface Variations**

It is suggested that journal traces (on precision surfaces and roundness instruments) be made periodically to monitor the axial and circumferential geometry of the journals. Standards for *all* engines:

**WAVINESS** - A widely spaced axial variation in surface linearity. Waviness should be held within .0025mm (.0001") T.I.R.

**LOBING** - A circumferential journal irregularity consisting of a gradually undulating surface contour with several peaks and corresponding valleys which are spaced approximately equally around the entire journal. The presence of definite three to seven lobe patterns in the circumference is highly undesirable. Lobing should be held within .0025 mm (.0001") T.I.R.

**CHATTER** - A circumferential journal surface irregularity marked by a large number of peaks and corresponding valleys which are approximately evenly spaced, but are not necessarily in evidence around the entire journal. Maximum chatter should not exceed .0013mm (.00005").

\*Applies to HEAVY-DUTY and HIGHLY LOADED ENGINES.

**Crankshaft Alignment**

Maximum misalignment allowed on adjacent main journals:  
 .025 mm (.001"); .013 mm (.0005")\*.

Maximum overall misalignment should not exceed .050 mm (.002"); .025 mm (.001")\*.

Crankpin and main journals should be parallel within .025 mm (.001"); .013 mm (.0005")\*.

**Method of Checking Crankshaft Alignment**

To check the alignment of main and rod journals, place the front and rear main journals on "V" blocks on a surface plate. Clamp an alignment bar (straight edge) on the surface plate parallel with the axis of the front and rear main journals. Set the height indicator to zero on the horizontal centerline of the front main journal and, with the indicator base tight against the alignment bar, move the gauge along intermediate main journals to check the alignment in the horizontal plane. The crankshaft may be rotated and the procedure repeated to check in other planes.

To check rod journals, rotate the shaft so that the centerline of the rod journals is on the horizontal centerline of the main journals. Reset the indicator on the centerline of the rod journals and proceed as above. If any taper, barrel, or hour-glass shape exists on any journal, it must be compensated for when determining alignment.

**End Clearance (Crankshaft Axial Play)**

Shaft Diameter	End Clearance
50-65 mm (2"-2¾")	.075/.175 mm (.003/.007")
65-85 mm (2¾"-3½")	.125/.225 mm (.005/.009")
85-125 mm (3½"-5")	.175/.275 mm (.007/.011")
125 mm (5") and over	.225/.325 mm (.009/.013")

**Bore Tolerance**

Shaft Diameter	Tolerance
Up to 80 mm (3¼")	.013 mm (.0005")
80-250 mm (3¼"-10")	.025 mm (.001")
250 mm (10") and over	.050 mm (.002")

**Taper**

TAPER ACROSS THE BEARING IN THE MOST HEAVILY LOADED AREA IS MORE CRITICAL THAN IN OTHER AREAS.

Length	Diametral Taper Tolerance	
	Tolerance	Tolerance*
Up to 25 mm (1")	.005 mm (.0002")	.003 mm (.0001")
25-50 mm (1"-2")	.010 mm (.0004")	.005 mm (.0002")
50 mm (2") and over	.013 mm (.0005")	.007 mm (.0003")

**Hourglass or Barrel-Shape**

Same standards as taper.

**Out-of-Round Condition**

Vertical dimension should not be larger than horizontal - .025 mm (.001") maximum out-of-round permitted if horizontal is larger than vertical.

**Rod Bore Finish**

A 1.5 - 2.3 micrometers (60-90 microinch) finish (obtained by boring, honing, or grinding) is recommended. This will ensure proper bearing contact and heat transfer.

\*Applies to HEAVY-DUTY and/or HIGHLY LOADED ENGINES.

**Connecting Rod  
Parallelism and  
Twist**

Parallelism and twist between the connecting rod bore and the wrist pin hole should be held to .025 mm (.001") when measured 150 mm (6") from the end of the wrist pin bushing (see Figure 6).

**Bolt Torque**

Rods must be machined at the same torque value used at final assembly in order to maintain size and roundness.

**Dowelling**

There should be a positive method (such as tongue-in-groove, serrated cap and rod P.L.'s, etc.) of aligning the cap and rod to prevent cap shift and/or twist, when the assembly is opened up for notching and bearing installation.

**Notches**

In order to provide sufficient clearance between the back of the bearing notch and the notch recesses in the rod and cap, the notches should be undercut.

**Connecting Rod & Crankcase Machining Practices**

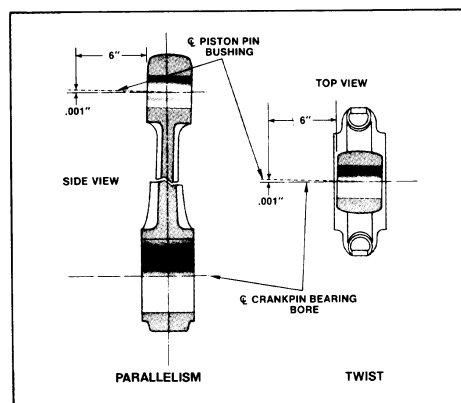

The importance of good machining of the connecting rods and crankcase cannot be over-emphasized if maximum bearing performance is to be expected. Special care should be exercised in the following areas:

Parting line surfaces: Should be flat and parallel.  
Should match evenly when subjected to proper bolt torque.

Torque: After the proper torque values have been established, they should be used during all subsequent machining operations and assembly.

Tightening should be done with a torque wrench, alternating from one side of the cap to the other so that the caps are drawn down evenly.

To maintain maximum roundness, the bolts must be loosened and retorqued between the rough and finish bore operations to minimize the effect of forging and machining stresses.

*Figure 6  
Examples of parallelism and twist*

## NOTES FOR THE MACHINIST AND ASSEMBLER

### Crankshafts

The crankshaft and the bearings which are associated with it are subject to wear and deterioration as a result of normal engine operation. Consequently, often at the time of engine reconditioning, the crankshaft will require regrinding to bring the journal and thrust faces back to serviceable condition. If this is necessary, before regrinding is performed, the crankshaft should be closely inspected for cracks, and wear or damage to flanges, keyways, screw-threads etc. which may involve a salvage operation, or which may necessitate rejection and replacement of the shaft.

The bearings from the engine may have shown evidence of other problems such as a bent or twisted crankshaft, which can be checked as in Figure 7.

*Figure 7*  
Crankshaft may be tested for straightness by rotating in vee-blocks and checking at points indicated.

Any abnormal condition must be corrected prior to regrinding the crankshaft. Reference data for crankshaft alignment is provided on page XVIII.

### Reclamation of damaged journals

It is sometimes found that due to complete failure of a bearing or other component, one or more journals of a shaft are damaged to an extent which may not permit regrinding to suit the smallest undersize bearings available. In these circumstances the shaft must be discarded unless the damaged journals can be reclaimed. Commonly used methods of reclamation are -

1. Metal spraying
2. Short arc and submerged arc welding
3. Hard chrome plating

Reclamation is best left to specialist workshops which have the required knowledge and equipment.

### Regrinding - nodular cast iron (SG Iron)

There has been widespread use of nodular cast iron (spheroidal graphite or S.G. iron) material for crankshafts in passenger cars and light duty truck engines. While this material has many advantages from the manufacturing point of view, it has a material microstructure requiring extremely critical attention to journal finishing - much more so than in the case of the other materials used for crankshafts; forged steel or cast normal flake graphite grey iron.

In a nodular iron crankshaft the free carbon is spheroidal in shape and a shell of ferrite always surrounds a nodule of graphite. After grinding the ferrite enveloped graphite tends to erupt at the surface in the form of raised pimples. These protrusions can be elevated above the surface by as much as .013mm (.0005") (which is in excess of the minimum oil film thickness), and are quite destructive to bearings.

To obtain a suitable journal finish free of these protrusions the following procedure is recommended:

1. Crankpin and journal grinding should be opposite to the direction of rotation of the crankshaft in the engine - see Figure 8.
2. Crankpin and journal polishing should be in the same direction of rotation of the crankshaft of the engine - see Figure 8.

The polishing usually is done with the use of 320 or 280 cloth and maximum stock removal of .0025mm (.0001").

Journal surface finishes of less than  $0,3\mu$  m (12 micro inch) are recommended.

*Figure 8*  
Diagrams show direction of shaft rotation for grinding and polishing when shaft rotates in a clockwise direction during normal operation.

When regrinding a crankshaft it is important to ensure that all radii which form a transition from the journal surface to the face of the web should be preserved, and that they should be smooth and free from scratches and defects which may give rise to stress concentrations - see Figure 9.

Rolling of the fillet radii as an insurance against fatigue failure, is a good practice.

Replacement bearings for most engines are available as either standard or undersize. An undersize bearing is one whose inside diameter is smaller (undersize) than that of the original (standard) size. Normal undersizes are .25, .50, .75 or (010, 020, 030). For some engines 1.00 (040) are available.

*Figure 9*  
*The radii which blend the cylindrical portions of the crankshaft into web faces should be smooth and of correct radius if stress concentrations are to be avoided.*

## Hardened shafts

Many diesel and high performance engines employ crankshafts which have been induction hardened, nitrided, or tufrided. Induction hardening usually provides a depth of hardening which allows regrinding to as much as 1mm (.040"). However, nitrided shafts have a hardened zone, permitting grinding to only about .25mm (.010") undersize. As nitriding has a markedly beneficial effect on fatigue resistance, it is essential that these shafts be renitrided when the permissible undersize is exceeded.

## Selection of replacement bearings

The main objective in selecting an engine replacement bearing is to duplicate the original conditions of the engine when it was manufactured. This dictates that an exact duplicate of the original bearing should be used, except a smaller inside diameter usually is required to compensate for journal wear.
