

Installation and Wiring

To mount, place your LED ULB light bar in the area you would like it to be permanently mounted. Once you're sure of the placement, drill 2 (#6) mounting holes and one wire hole with care and then feed the wires through the center hole and attach the ULB with the included mounting screws, washers, and bolts. To wire the ULB tap the black wire to a ground source. Locate your brake light wire and tap the red wire from the ULB to the brake light wire. Finally tap the white wire onto your running light wire. Be sure that the ULB is secure and all of your connections are secure, now you can power up your ignition and check the functionality!
